01

TripFit

for Pegasus

A more personal way to plan, choose and book a trip.

09 OCT 2026

02

What makes Pegasus, Pegasus?

“Everyone has the right to fly”

Affordable access

Help passengers find a workable journey.

Freedom to choose

Recommend extras that fit their needs.

Digital convenience

Reduce repeated effort without taking control.

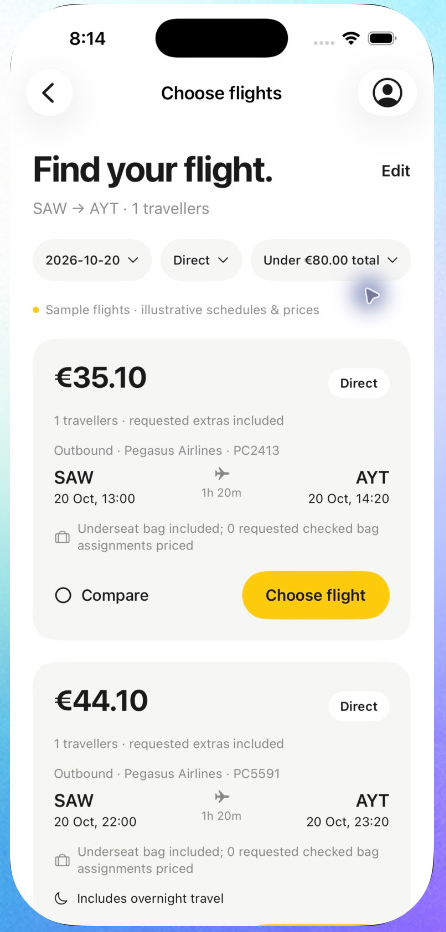

Pegasus states the promise. TripFit translates it into a product hypothesis for planning and booking.

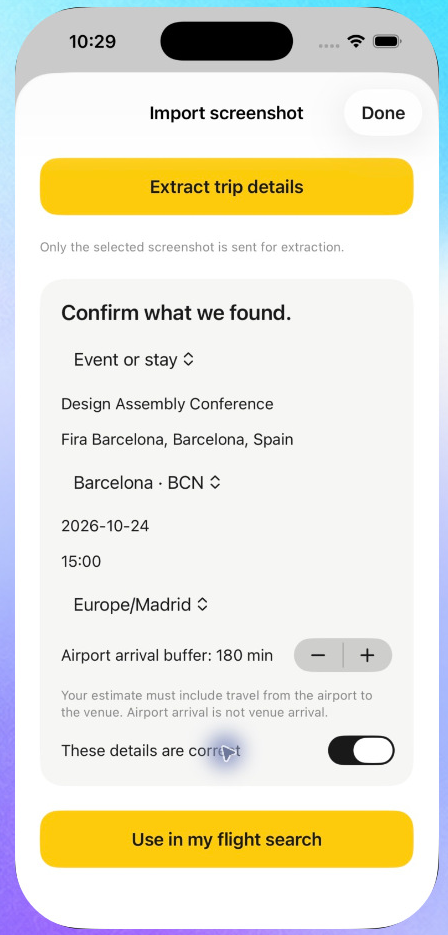

03

A trip plan becomes a flight search

Describe the trip.
Or import an invitation,
event or flight screenshot.

Review editable requirements.
Set an arrival or connection buffer.
Keep important constraints locked.

Real text/image extraction. Incoming flights stay separate from onward pricing. Timing buffers do not guarantee a transfer.

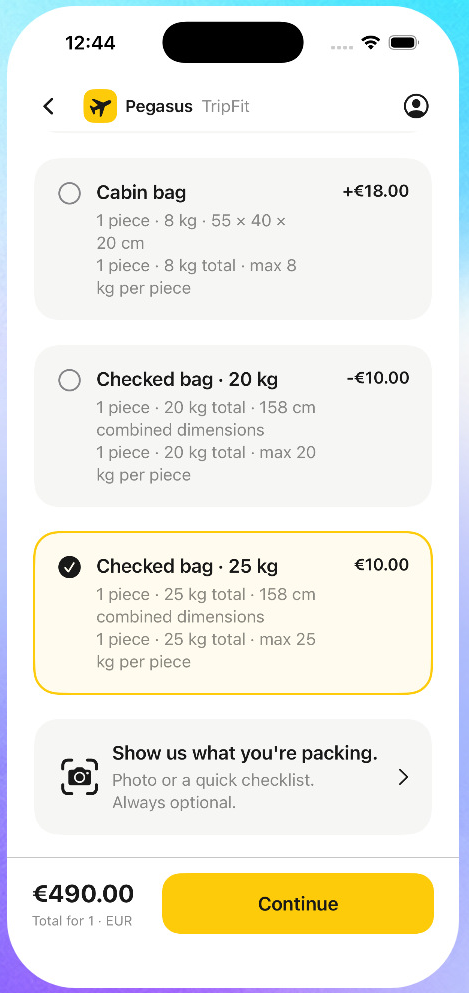

04

A photo helps choose the right bag

Vision identifies visible items.
You confirm the weight and size.
Catalogue rules calculate fit and price.

Keep your allowance, add a bag or compare an eligible bundle.

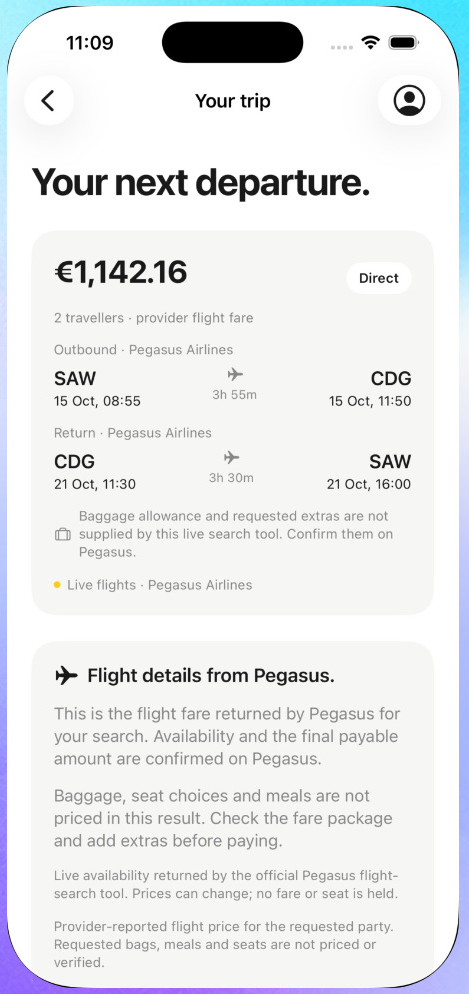

Actual photo test and native baggage UI. In-app bag prices use demo inventory. Weight cannot be measured from a photo.

05

Real flights.
Clear choices.

Live Pegasus availability and fares.
Compare candidates against the trip.
Review explicit nearby alternatives.

The native demo also covers bags, seats, meals, bundles, review and saved trips.

Live selection continues on Pegasus to book and pay. In-app checkout is demo only: no charge and no ticket issued.

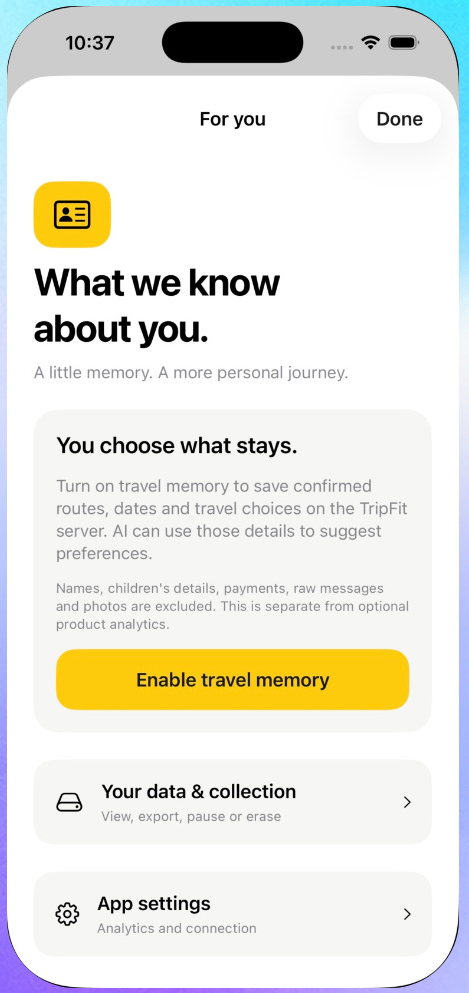

06

What we know about you

Aisle seat. Cabin bag. Direct flights.

Learn from confirmed trips and requests.
Show where each preference came from.
Let the traveller correct, lock or forget it.

Reuse a preference only with the customer’s control.

Separate opt-in. Example preferences came from fictional test activity. Searches show interest, not a completed visit.

07

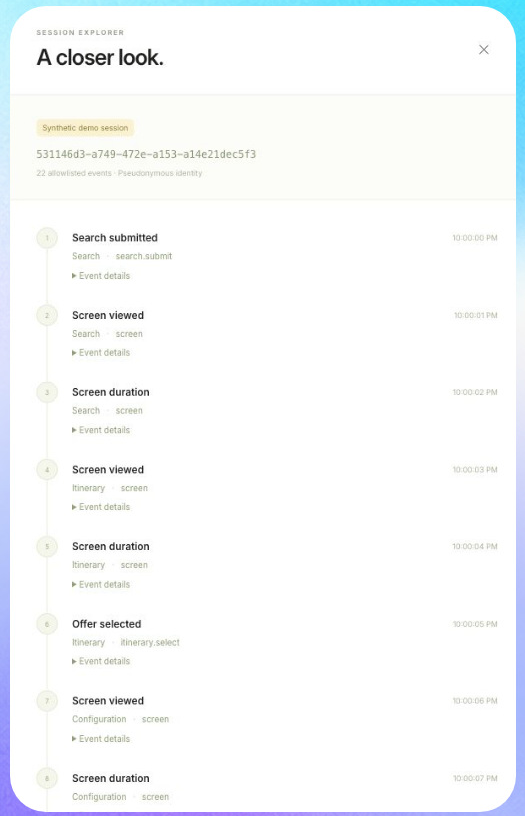

Personalisation needs permission

Personal travel memory

Confirmed routes, dates and choices.
Pause, inspect, export or erase the profile.

Separate airline analytics

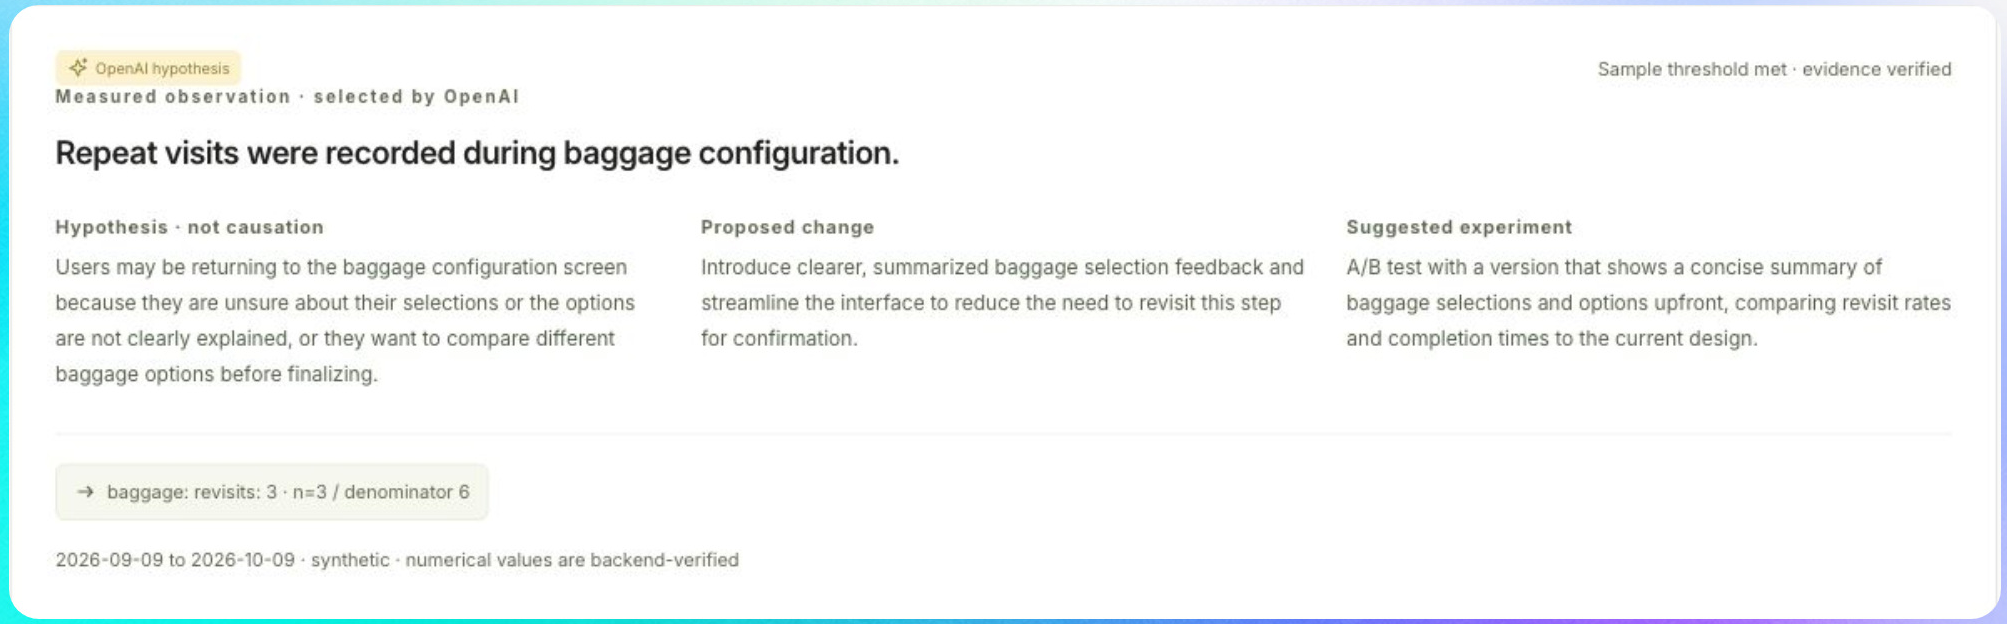

Pseudonymous events, active time and errors.

Stored memory/analytics exclude raw text, photos, names and payments. Requested AI analysis sends selected inputs for processing.

08

Where the booking journey gets harder

Actual dashboard and real AI output from synthetic rehearsal events. Hypotheses require a controlled experiment.

09

Built for the Pegasus model

Easier booking

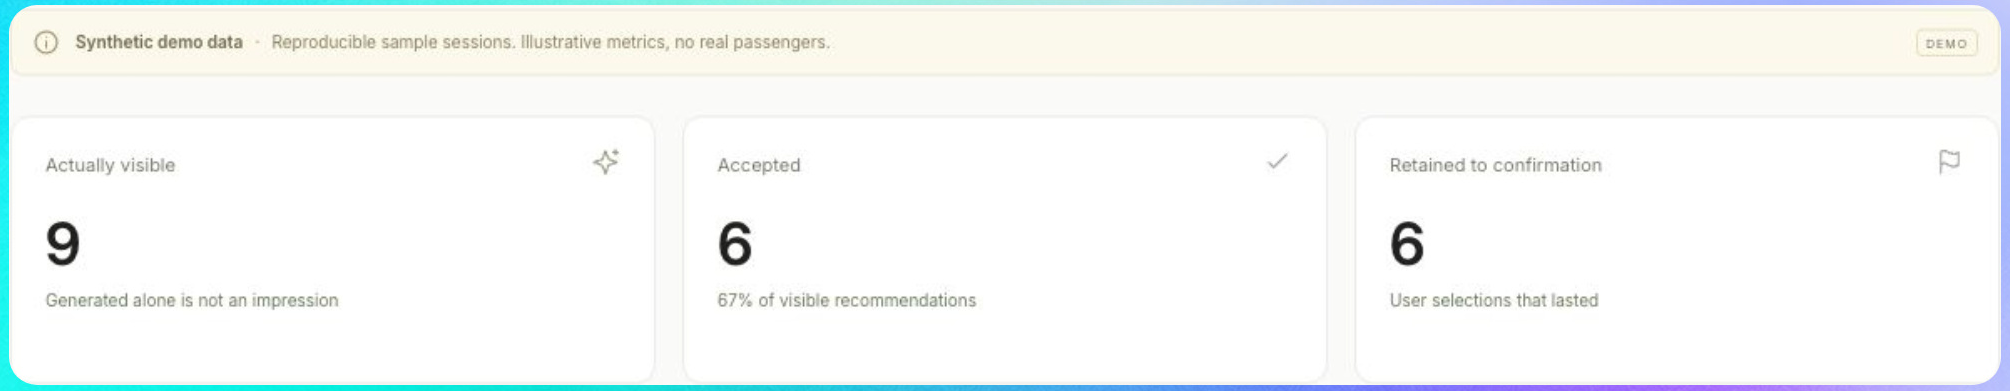

Completion and repeated input

Relevant extras

Fit, acceptance and corrections

Customer trust

Control, opt-outs and errors

80 backend tests / 58 booking checks / 26 profile checks. Screenshot metrics are synthetic; business gains remain pilot hypotheses.

10

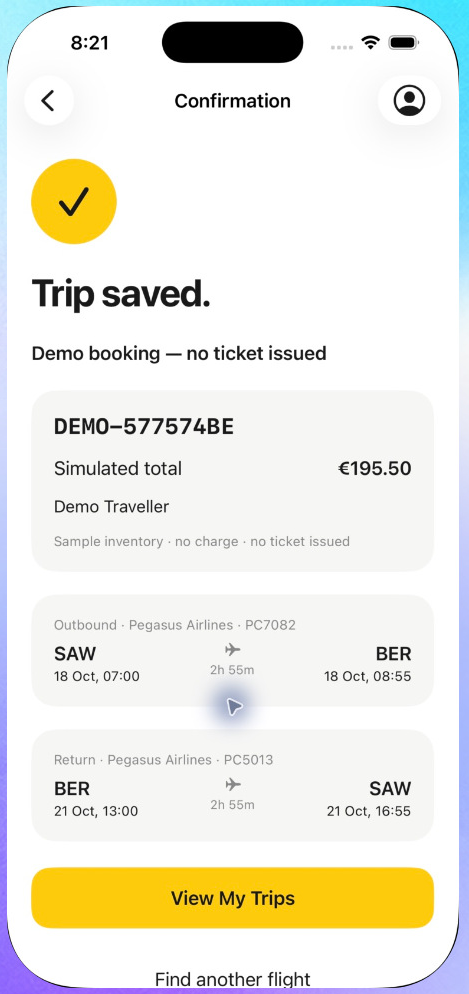

A more personal Pegasus journey

A controlled pilot

Start with one route cohort.
Connect authorised booking services.
Measure completion and relevant choices.

Code, README and submission deck

github.com/MusayevAli/Pegasus

Hackathon prototype. Demo confirmation shown. Authorised extras, payment and ticketing integration remains required.
